Gumtree Android App development challenge

Your task is to implement View Item Screen for the Gumtree app. Have a look at our current View Item screen Screenshot is attached but please check the App as well (search for Gumtree or Gumtree Beta).

Please implement the screen (using XML, fragments and activities).

- Mock the data endpoints the way you feel suits (e.g. use Content Providers or simple Java objects)
- Screen must be usable on devices min sdk version 14 and optimised for the different screen sizes
- We would expect the following to be implemented in your solution:

o Landscape and portrait view and screen rotation / Call for actions / The share button / Support for multiple pictures / support for tablet and phones

- Suggest design improvements if you feel something can be improved
- If you feel some data on the screen is missing to make it even better experience for a user (or more valuable for the user) feel free to add it.

Send us the result as an apk (send it to gumtreetasks@hotmail.co.uk) and also provide a link to the to the source code (github or bitbucket)
